

## # Difference between MP & MC:

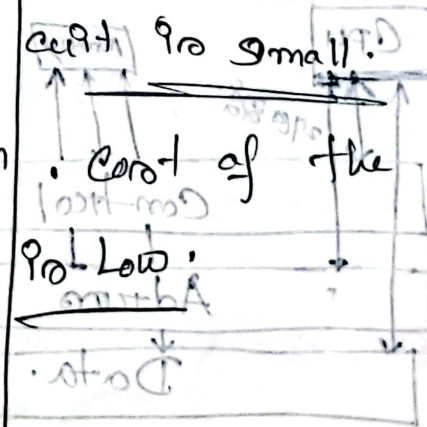

### Microprocessor

- It is a heart of computer system.
- Here memory and I/O components need to be connected externally. (circuit)
- Memory and I/O has to be connected externally, so the circuit becomes large.
- Cost of the entire system is high.

### Microcontroller

- It is the heart of the embedded system.
- It has a processor along with internal memory and I/O components. (circuit)
- Memory and I/O already present and the internal circuit is small.
- Cost of the entire system is low.

# Micro-Controller

## Seg 7

Microcontroller is a integrated circuit which

CPU, ALU, Register, Memory, Serial communication  
Timer, Counter, I/O, are included ~~for~~ for executing  
specific tasks.

### Feature of Microcontroller 8051.

- 8051 is complete computer system built on one chip.
- 8051 operates at 12 MHz clock frequency
- 8051 has 8 bits of ALU.
- 8051 has 8 bits of Data Bus.
- 8051 follows harvard Architecture (Separate memory and data storage path)
- 8051 has 4kB of internal ROM for program storage
- 8051 has 128 bytes of RAM for data storage
- 8051 has four 8 bits of IO ports

Program status Enable  
RD & WR Read and write  
External memory.

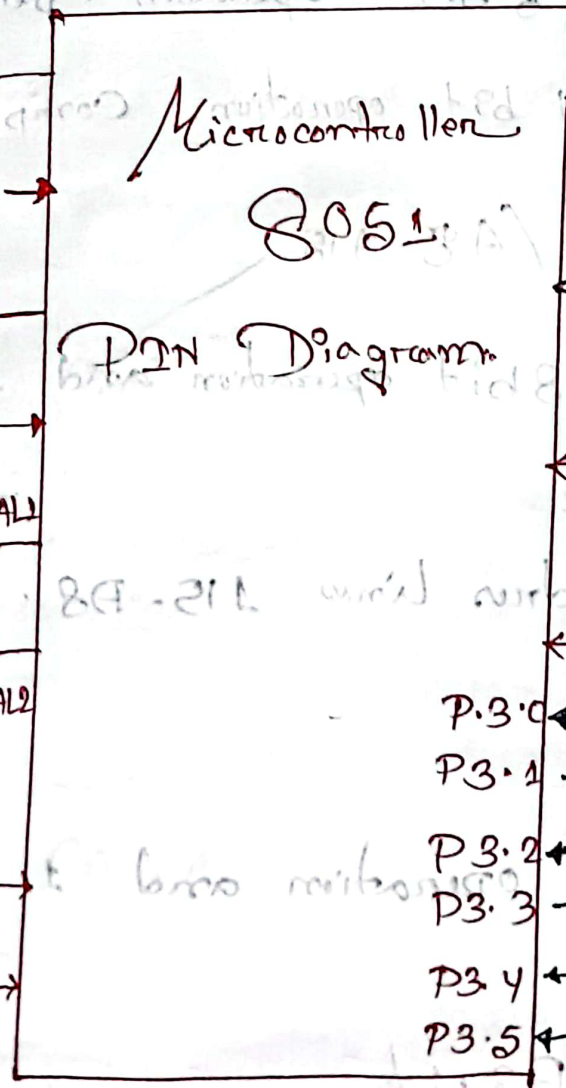

Enable External access - EA

Separate address and data - ALE  
Resetting program - Reset

Oscillator input 12MHz

(5) VCC

(GND) VSS

Port 0 { P0.0 - P0.7 }

AD7-AD0

Port 1 { P1.0 - P1.7 }

Port 2 { P2.0 - P2.7 }

AD15-AD8

Port 3 { P3.0 - P3.7 }

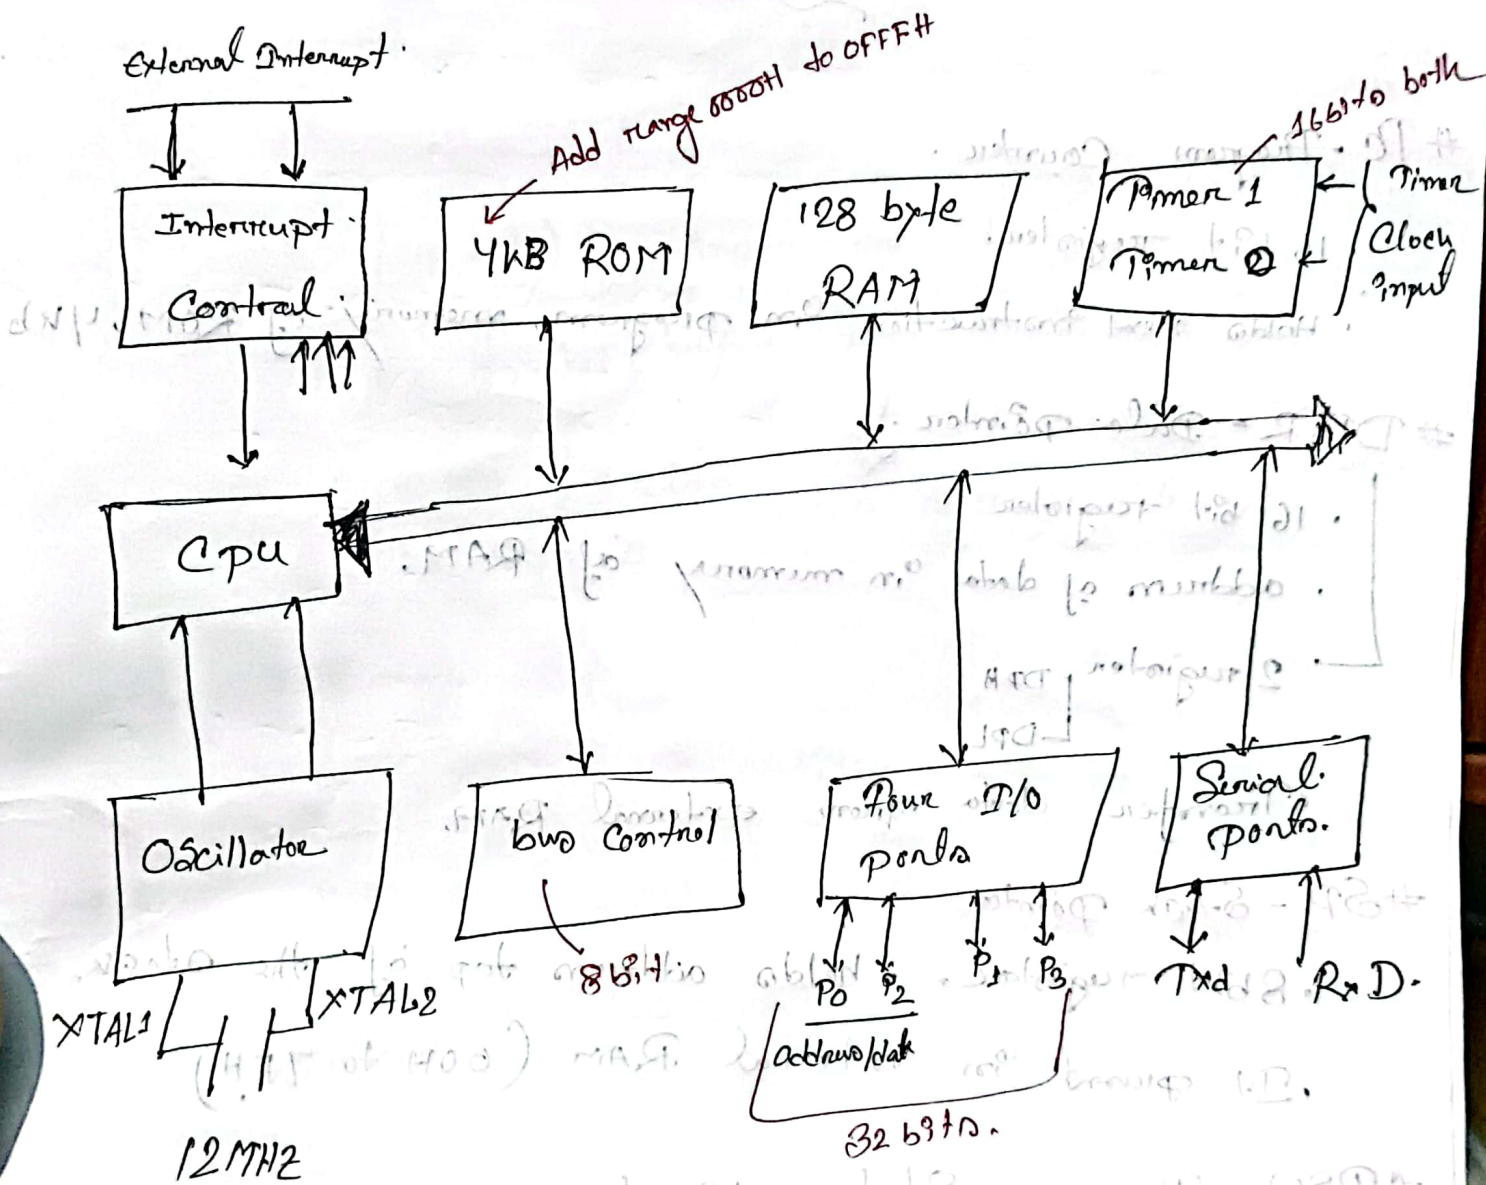

P3.0 - Serial data input (RXD)

P3.1 - Serial data output (TXD)

P3.2 - INT0  
P3.3 - INT1 } Interrupts

P3.4 - T0  
P3.5 - T1 } Timer clock input

# Block Diagram. 8051

CPU is responsible for all arithmetic logic form.

## Components of 8051

# PC - Program Counter.

- 16 bit register

- Holds next instruction in program memory of ROM, 4Kb

# DPTR - Data Pointer.

- 16 bit register

- address of data in memory of RAM.

- 2 register

DPH

DPL

- Transfer data from external RAM

# SP - Stack Pointer

- 8 bit register • holds address top of the stack.

- It present in internal RAM (00H to 7FH)

# PSW - Program Status Word.

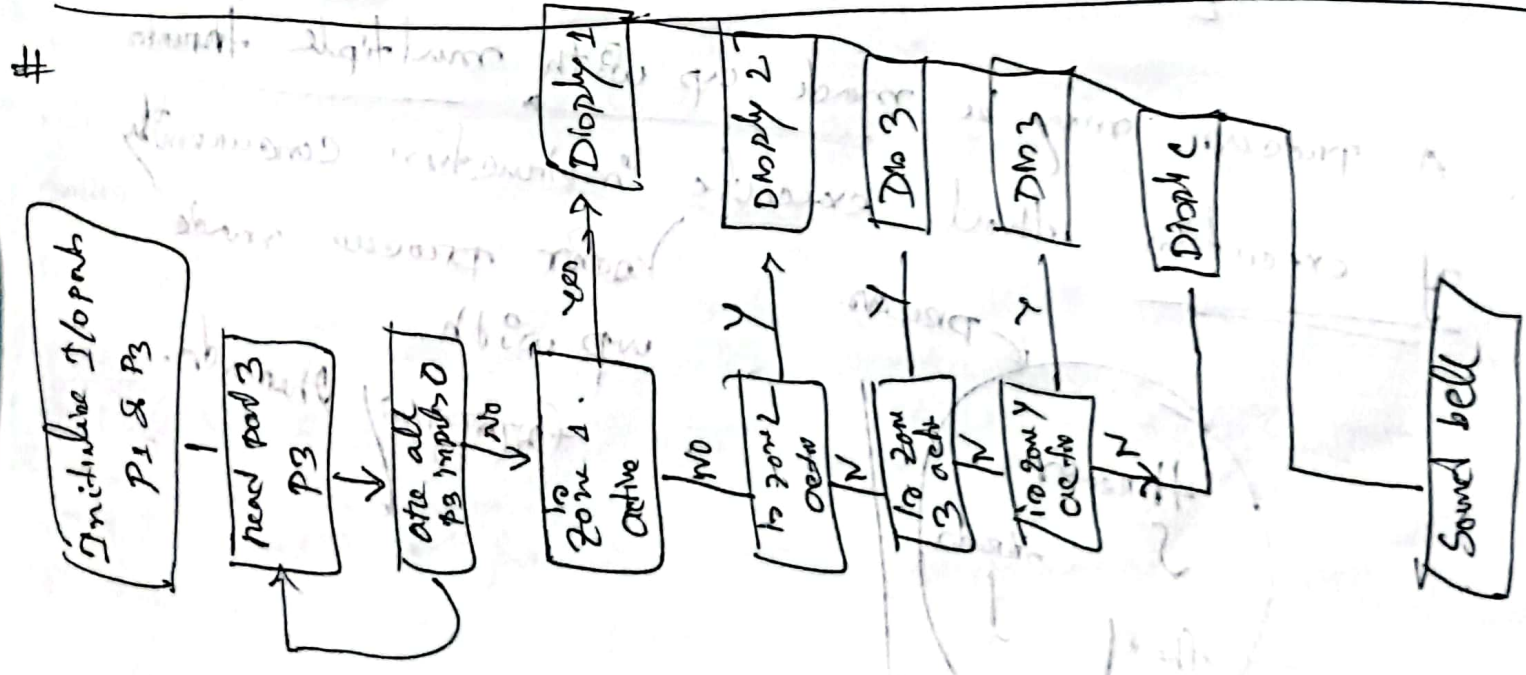

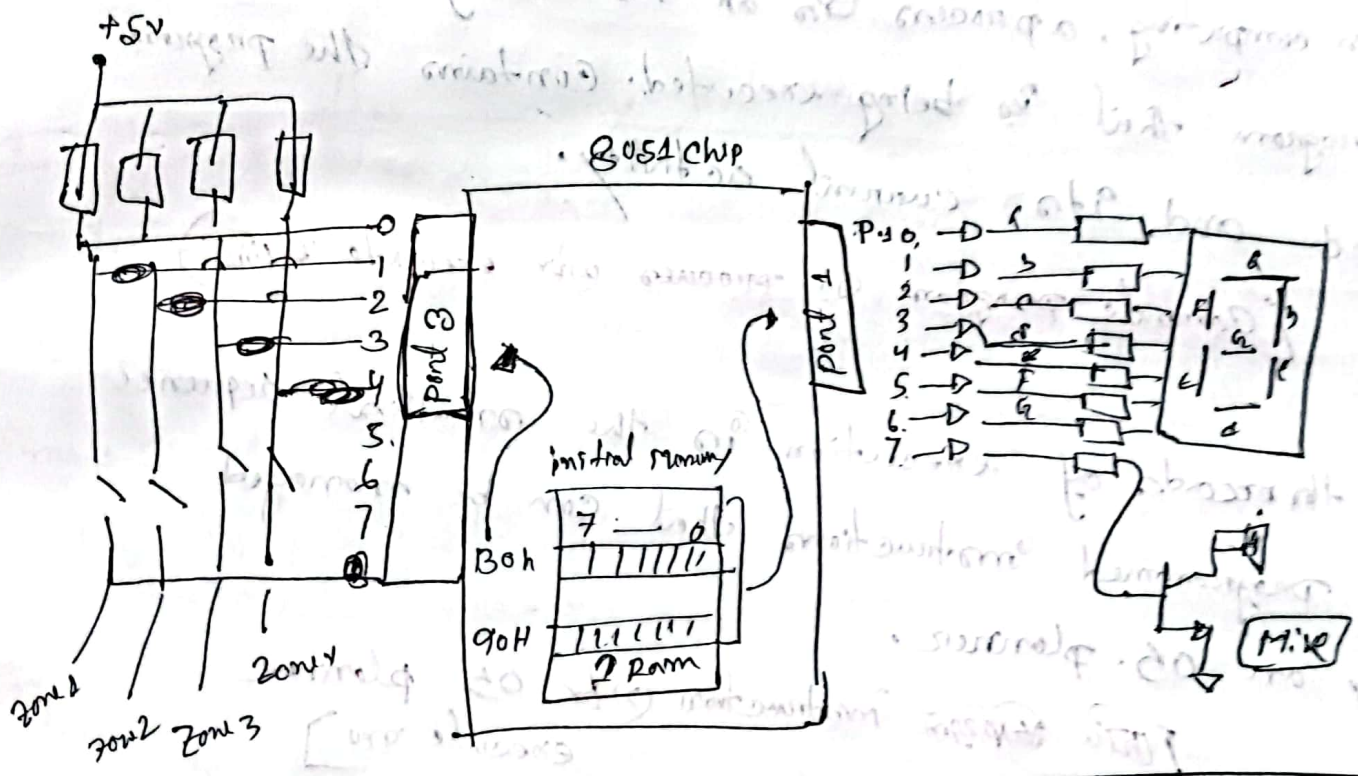

- 8 bit register • flag register. It gives status after every instruction execution in program

- It is 8 bit addressable register.

## Addressing Modes of 8051.

### # Immediate Addressing Mode

- Data specified (12 bits) in instruction itself.
- " by symbol before data in instruction.

Example: `MOV A, #15H` ; A ← 15H. (data @ 15H) `MOV DPTR, #1000H`

### # Register Addressing Mode.

- Data is specified by register in instruction.
- The permitted are A, R7, R6, ..., R0.

Example: `MOV A, R2` // `MOV R1, R2` not allowed 8051.  
`MOV R2, A`

### # Direct Addressing Mode.

- address of operand is given in instruction.
- only internal RAM & SFR allowed.

Example: `MOV A, 35H` (00H → 7FH, 80H → FFH) ; A ← 35H

`MOV 30H, 35H` (4) memory address

## # Indirect Addressing Mode

- address of operand will be given by register

- Internal & External RAM accessed

- Internal RAM with 8 bits.

Ex:  $\text{MOV } A, @R1$  ,  $\text{MOV } @R2, A$

- External RAM with 16 bits of addressing by.

DPTR "X" is used here.

Example:  $\text{MOVX } A, @\text{DPTR}$

$\text{MOVX } @\text{DPTR}, A$

## # Indexed Addressing Mode

- used to access data from code memory (internal & external ROM)

- In instruction use C to ~~operate~~ operate.

Example:

$\text{MOVC } A, @A + \text{DPTR}$

$\text{MOVC } A, @A + \text{PC}$

C is used Indexed
