

# Stepper motor

It has two parts [this motor is rotate by stepwise]

1) Stator

2) Rotor

Here, permanent magnet is used.

ଏହି ମୋଟର ଦ୍ୱାରା speed କମ୍ ହେଉଛି  
କିନ୍ତୁ torque ବଢ଼ି ଯାଏ

ଅର୍ଥାତ୍ ଏହା ପୋଲ ଦ୍ୱାରା energized କରା ଯାଏ,  
ଏବଂ କାରଣ ଏହା step ଦ୍ୱାରା (control) କରା ଯାଏ,  
ତେଣୁ stepper motor ସାମାନ୍ୟତା ସ୍ଥଳୀରେ  
cycle complete କରୁଛି 200 steps ଏବଂ ଏହା ସ୍ଥିର  
ହୁଏ, ଏହାର ପ୍ରତି step  $\frac{360^\circ}{200} = 1.8^\circ$  step angle  
ହୁଏ, stepper motor max<sup>m</sup> 90° ଏବଂ ଏହା step  
angle ~~ହେଉ~~ cover କରୁଛି ନାହିଁ,  
minimum step angle is 0.72°, max<sup>m</sup> 90°.  
ଏବଂ 1.8°, 2.5°, 7.5°, 15° ଏହି step angle  
ଦ୍ୱାରା ବ୍ୟବହୃତ ହୁଏ।

Defination → A stepper motor, also known as step motor  
or stepping motor, is an electrical motor that  
rotates in a series of small angular steps instead  
of continuously.

N.B: A STEPPER motors are controlled by a driver, which sends the pulses into the motor causing it to turn.

## Stepper motor Driving modes/Techniques:

1) Wave mode / Single Coil excitation mode →

गुणवत्ता

UPward ↑ North pole create.  
down ↓ South pole "

Here, only one phase is energized

at a time.

Ex → If Coil <sup>(pole)</sup> A is energized, then North pole (N) and South pole (S) is created here. As a result, the Rotor (Permanent magnet) is aligned with the magnetic field generated by the coil.

It is same for coil (pole) B, C, D.  
Here, the Rotor spins 90° clockwise with the magnetic field generated by the coil (pole).

Condition-1

Condition-2

Condition-3

Condition-4

Truth table →

Condition	A	B	C	D
1	1	0	0	0
2	0	1	0	0
3	0	0	1	0
4	0	0	0	1

logic diagram

2) full STEP Mode (Here, step angle is also 90°)  
 Here, two phases are always energized at the same time. The steps are similar to the wave mode ones. N.B → The motor is able to produce a higher torque since more current is flowing in the motor and a stronger magnetic field is generated.

Condition-1

Condition-2

Condition-3

Condition-4

Truth table

Condition	A	B	C	D
1	1	1	0	0
2	0	1	1	0
3	0	0	1	0
4	1	0	0	1

logic diagram

9) Half step mode:-

It is the combination of wave and full step modes. The step size is to be reduced by half (in this case  $45^\circ$  instead of  $90^\circ$ ).

It is higher (torque) when both phases are energized and weaker when only one phase is energized. The torque produced by the motor is not constant.

Condition-1
